Service options

Vulnerability scanning

We can fire off several vulnerability scanners based on the type of target or a mixture of several vulnerability scanners with different purposes to cover a wider area. This is the first step toward securing your company and can already eliminate a big portion of malicious actors. Remember that most bad actors try to look for low-hanging fruit, with this option you can assure yourself that fruit has already been picked and eaten.

Prices range from 1250$ to 7500$ depending on the complexity of the assignment and whether we are required to test the target authenticated or not. (this includes all license fees)

Pentesting

We offer pentesting at several levels and every level increases your security but this also comes with a cost since each level requires a lot more testing than the previous one.

Level 0

At level 0 we guarantee basic levels of coverage. This usually means compliance testing but don't let the name fool you. The coverage might be basic but that is only compared to the other levels. We follow specs like NIST and OWASP to reassure you and cover as much ground as possible so we don't cost you any more than we have to but can still give you a good idea of where your security is at. Every report comes with a compliance section.

Prices range from 4000$ up to …$ depending on the size and complexity of the project.

Level 1

At level 1, we include business logic in the mix. We get a comprehensive view of your business logic and try to abuse it in ways automated scanners can not find. We do this through a combination of documentation, business analyst meetings, and using the applications as a normal user would. These types of attacks are particularly dangerous because they are often unnoticed for a long period of time.

Prices range from 10 000$ to …$ depending on the size and complexity of the project.

Level 2

Currently, we do not offer governance-level pentesting.

Custom scripting

Sometimes you might need to repeat an API pentest and you might want to do it in-house but lack the required knowledge to do so or just lack the manpower, in that case, it would silly to hire an entirely new team to develop these security-related scripts for you. When they are done, they are done after all. This is where we can come in and help! We have a team of highly skilled developers that can create automation scripts you can simply re-run yourself and test every build with the same accuracy. We can even do maintenance and will give you an estimation up-front of the costs after agreeing on the acceptance criteria.

Prices start at 125$/h.

CI/CD pipeline automation for API testing

Sometimes, you might want to take a step further and include these tests in your CI/CD pipelines. We can add these possibilities into our scripts and work with your DevOps engineers to implement our scripts so that you can have a detailed coverage report after every build, UAT builds, or before every release.

Developer training: Developing security minded

Through some technical challenges, we will train your developers in one session of 8 hours to allow them to program vulnerable applications on our servers so they can explore this dangerous world in a safe environment.

Also available in a 4-hour, condensed option!

8h: 800$ Per person, 5 minimum, own laptop required with a text editor and FTP client

4h: 400$ Per person, 5 minimum, own laptop required with a text editor and FTP client

Staff training: Internal security testing

We can train your internal QA testers and transform them into security testers who are fully trained according to your internal guidelines and aimed directly at the types of products you offer. We will meet before the training to determine any specific needs and adapt our training accordingly. This training takes anywhere from 8h to a full week.

Prices: 800-4000 per person, a laptop that can run burp suite or OWASP zap is required for web pentesting. Postman is required for API pentesting.

SLDC assessment

OWASP WSTG and PTES are methodologies that allow us to investigate a complete SDLC and take security to the roots of your organization. This is all done in an effort to reduce costs and introduce more specialized coverage at certain points in your cycle. We are going to look at your software, how your deploy, what kind of automated tests are in place, and your architecture to allow for maximum coverage.

Prices start at 125$/h
